

What you don't know about magnesium is probably adversely affecting your health *already*:

- When we're deficient in magnesium over 300 enzymes in our body are unable to function properly.
- Magnesium deficiency has been scientifically identified as a critical factor in the onset of a wide variety of diseases, from heart disease, diabetes, hypertension, inflammation and stroke, to Alzheimer's, autism, cancer, and many more.
- For various reasons and to varying degree, two-thirds or more of the population is magnesium deficient.
- Traditional (allopathic) medical protocols currently do not factor magnesium deficiency or replenishment into standard treatment strategies.
- As medicine is currently practiced, Americans today are living longer, but are also living longer with chronic disease, yet scientific studies have confirmed that many chronic diseases respond positively to magnesium replenishment.

In *Transdermal Magnesium Therapy*, Mark Sircus, Ac., O.M.D., a nationally certified acupuncturist, honorary doctor of Oriental Medicine, and founding director of the International Medical Veritas Association (IMVA), introduces you to the most important overlooked mineral on the planet.

His passion, insights, and research into the workings of this mineral will help you determine whether you are among the more than 200 *million* people in America (or *billions* around the world), who are magnesium deficient.

After introducing you to the best method of magnesium replenishment (transdermal), using a natural, abundant, ocean derived magnesium chloride solution that is absorbed through the skin, you'll be ready to safely and effectively take magnesium replenishment into your own hands.
